- Keeping your e-mail private
- Removing file size limits
- Bringing IT compliance

Making e-mail better.

Every day your business exchanges a wealth of data with customers, suppliers and partners. A big part of this communication takes place via e-mail and Outlook and is constructed in your Office applications. However, often the information is highly confidential or captured in files that are simply too big to send via e-mail. So what happens then?

There are many different ways to get around this problem but our advice is to use the tools you already have!

Cryptshare for Office 365 & Outlook enables you to secure and share confidential e-mails and files without size restrictions, completely ad hoc via your regular e-mail directly from your familiar Outlook interface. By solving these known problems in e-mail Cryptshare provides the fastest and most simple solution.

Extend the power of your e-mail

Cryptshare however provides more than low cost security. Our customers report that the usability and productivity gains from using Cryptshare in their daily work life deliver far greater benefits than just financial savings. The user interface is familiar and intuitive to use and offers key functions as they are required. The interface design integrates into MS Outlook seamlessly and is focused on ease of use and a positive user experience. No training is required. The transaction progress display bar gives the user a clear status of all current incoming and outgoing transfers.

The sidebar gives the user control over passwords, attached files and all sent and received e-mails. A prominent one click button enables users to send e-mails and large files via Cryptshare as quickly as a standard unencrypted e-mail.
Customers tell us that the Cryptshare add-in makes sending large files and sensitive information straight from their familiar e-mail environment simple and part of their daily routine.

So why look for any other way to do this?

Sender

- Sidebar for upload and download status
- Control assigned passwords
- Send entire folders by drag and drop
- Easy to use

Recipient

- Save e-mails and files directly to your inbox or locally
- No browser needed
- Add-in free for external recipients

Easy administration, more security, less cost

Cryptshare's powerful policy engine enables specific risks to data in your organisation to be countered and policies for use to be defined centrally from a comprehensive administration console based on defined needs. From a central server inside your DMZ Cryptshare is, by default available to all of your e-mail users. You may elect to create different policies for different groups providing legal, administrative and economic advantages.

It also lets you comply with data protection guidelines easily. A self-cleansing system without the need for daily user management keeps administrative efforts low and gives your IT time to focus on other pressing tasks. Furthermore, using Cryptshare unburdens the company's e-mail system and therefore offers the opportunity to save money and resources on storage and back up.

In combination with a simple pricing model return on investment for use is measurable and short.

Cryptshare®

Making e-mail better

Administration

- Use of several e-mail accounts and assigning different Cryptshare servers to each
- Central management of policies and options
- Simple company-wide roll out
- User data retrieved from MS Active Directory
- Powerful policy tools to enforce compliance rules via Cryptshare server

Security

- Encryption of subject line to protect you from social engineering attacks.

How it started

Befine Solutions was founded in 2000 a specialist software developer working on behalf of blue chip corporate clients. Over the years, a number of solutions developed for one client were found to be useful to others with modest changes or simple customisation. This allowed the team to meet requirements of many clients by utilising re-usable, stable, scalable and effective solutions to complex problems. We believe we can solve the problems that others cannot, and so that is what we do.

The development of Cryptshare

Cryptshare was shipped to first customers in 2007 immediately leading to requests from others to buy a licence. The problems of the ad hoc exchange of large files and securing email were quickly identified as a more universal problem in large and small companies across all industries. Feedback from the market and a strong belief in the team helped define a product roadmap specifying the additional features required by this now fast growing group of customers. Ease of use, strong encryption, frequent updating, sophisticated management, configuration and policy control tools and the ability to communicate with other applications via a simple API and much more have been added, with patents pending for key innovations.

Cryptshare today

Customer numbers have grown rapidly since 2010 with resellers appointed in many countries enabling sales to accelerate quickly. Investment in the team has allowed more specialised development of the roadmap, greater technical support and dedicated product management as well as much more sales and marketing activity with customers in 30 countries, and more than 3 million licenced users so far.
